

# Building Robot Brains

**Week #3**  
**Prof. Ryan Kastner**

# Robot Brains

- ❖ When you write a program, you are actually building a brain for your Robot
- ❖ In the computing world, this brain is replaceable
  - ❖ Firefox as a Browser
  - ❖ iTunes as a Media Player
  - ❖ VLC as a Movie Player
- ❖ By learning to write Robot programs you are also learning to write computer programs

# Structure of a Robot Brain

---

- ❖ The basic structure of a Program (Brain) is:

*def main():*

*<do something>*

*<do something>*

*...*

- ❖ Every Robot program will begin with

*from myro import \**

*init()*

- ❖ Then you import other files/modules or you ask the robot to do something using the modules

# Robot Dance

- ❖ Make the Robot do some random movements using function *moves()*

```
# The main dance program
```

```
def main():
```

```
    print "Running the dance routine..."
```

```
    yoyo(0.5, 0.5)
```

```
    wiggle(0.5, 0.5)
```

```
    yoyo(1, 1)
```

```
    wiggle(1, 1)
```

```
    print "...Done"
```

```
main()
```

The function 'print' will print out what you have entered in the double quotes " "

When the main() function is called, the functions in main() are called in order so you get the output:

```
Running the dance  
routine...  
...Done
```

# Pythonese

---

❖ Try this:

*speak("Dude! Pardon me, would you have any Grey Poupon?")*

❖ Python comes with several other useful libraries or modules

❖ Libraries are made up of sets of functions

❖ You can import the commands provided in a library

❖ Every programming language has a set of predefined functions and a mechanism for defining additional functions

# Pythonese – Rules

---

- ❖ A name in Python must begin with either an alphabetic letter (a-z or A-Z) or the underscore (i.e. `_`) and can be followed by any sequence of letters, digits, or underscore letters

*jitterBug2*

*my\_2\_cents*

- ❖ By giving functions a name you have a way of defining new functions

# Pythonese – Rules

---

- ❖ Functions can take parameters that help customize what they do. In the above example, you can issue the following two commands:

```
>>> yoyo(0.8, 2.5)
```

```
>>> yoyo(0.3, 1.5)
```

- ❖ It is better you choose names which makes sense

For example:

A function *turnRight()* should turn the robot right and NOT make it go in circles or dance

PS: This is not mandatory though! ☺

# Pythonese – Rules

---

## ❖ Values

- ❖ Designating values by names is an important feature of Programming
- ❖ We can create names for speed, temperature etc.

### ❖ Designating Values

*aveHighTemp = 37*

*DowIndex = 12548.30*

*myFavoriteRobot = "C3PO"*

- ❖ *Syntax: <variable name> = <expression>*
  - ❖ *Strings are given within double quotes*

# Pythonese – Rules

❖ What you type at the Python prompt `>>>` is an Expression

```
>>> 5
```

```
5
```

```
>>> 5 + 3
```

```
8
```

```
>>> 3 * 4
```

```
12
```

```
>>> 3.2 + 4.7
```

```
7.9
```

```
>>> 10 / 2
```

```
5
```

- Addition (+), subtraction (-), multiplication (\*), and division (/) can be used on numbers to form expressions that involve numbers
- Whole numbers are called *integers* and those with decimal points in them are called *floating point* numbers
- Python handles both (*try 10.0/3.0*)

# Pythonese – Rules

- ❖ Strings
- ❖ Python requires that strings be written enclosed in quotes: which could be single ('I am a string'), double ("Me too!"), or even triple quotes ("I'm string as well!")
- ❖ Python also provides some operations on strings using which you can write some useful string expressions

```
>>> mySchool = "Bryn Mawr College"
```

```
>>> yourSchool = "Georgia Institute of Technology"
```

```
>>> yourSchool+mySchool
```

```
'Georgia Institute of TechnologyBryn Mawr  
College'
```

# Pythonese – Computation

---

- ❖ Estimate the world population growth in a year and also per day. Given that on January 1, 2008 the world's population was estimated at 6,650,000,000 and the estimated growth is at the rate of +1.14%

# Pythonese – Computation

---

- ❖ In a large program if you want to change some value, you can search for the value line by line and modify your program to reflect the new value
- ❖ Instead you can use the *input* facility of Python
- ❖ Python has a simple input command
  - ❖ *Syntax*: `<variable name> = input(<some prompt string>)`
  - ❖ `Population = input("Enter current world population: ")`

# Pythonese – Computation

This is how your GUI will look when you use the *input* function

```
///  
This program computes population growth figures.  
Enter current world population: 6650000000  
Enter the growth rate: 1.14  
World population today is 6650000000  
In one year, it will grow by 75810000.0  
An average daily increase of 207698.630137  
>>> main()  
This program computes population growth figures.  
Enter current world population: 6725810000  
Enter the growth rate: 2.2  
World population today is 6725810000  
In one year, it will grow by 147967820.0  
An average daily increase of 405391.287671  
>>>
```

# Pythonese – Repetitions

---

- ❖ If you want the dance behavior 10 times

*for i in range(10):*

*dance()*

- ❖ *Syntax for repetition:*

*for <variable> in <sequence>:*

*<do something>*

*<do something>*

*...*

- ❖ *range()* function is used to specify a sequence

*range(10)*

*[0, 1, 2, 3, 4, 5, 6, 7, 8, 9]*

# Pythonese – Repetition

---

- ❖ What if you want to make the robot dance forever??
- ❖ How do you stop it?
- ❖ In addition to repeating by counting, you can also specify repetition using time

*while timeRemaining(10):*

*<do something>*

*<do something>*

...

# Summary

---

- ❖ Values in Python can be numbers (integers or floating point numbers) or strings
- ❖ Operations can be performed on Values
- ❖  $\langle \text{variable name} \rangle = \langle \text{expression} \rangle$

This is how Python assigns values to variables

- ❖  $\text{range}(10)$

Generates a sequence of numbers from 0..9

- ❖  $\text{range}(n1, n2)$

Generates a list of numbers starting from  $n1 \dots (n2-1)$

$\text{range}(5, 10)$  will generate the list of numbers  $[5, 6, 7, 8, 9]$

- ❖  $\text{range}(n1, n2, \text{step})$

Generates a list of numbers from  $n1 \dots (n2-1)$  in steps of step

$\text{range}(5, 10, 2)$  will generate the list of numbers  $[5, 7, 9]$

# Summary

---

## Repetition

*for*  $\langle \text{variable} \rangle$  *in*  $\langle \text{sequence} \rangle$ :

$\langle \text{do something} \rangle$

$\langle \text{do something} \rangle$

...

*while* *timeRemaining*( $\langle \text{seconds} \rangle$ ):

$\langle \text{do something} \rangle$

$\langle \text{do something} \rangle$

...

*while* *True*:

$\langle \text{do something} \rangle$

$\langle \text{do something} \rangle$
